

WHAT IS CLAIMED IS:

CLAIMS

1. A method performed by a machine interfacing with a system integrator, for integrating a plurality of completed executable programs as components to build an integrated program, comprising the steps of:

5       invoking script for selecting and generating plural choices of components and choices of their parameters to be used for integration of the plurality of completed executable programs;

10       providing to the system integrator the choices of components and their parameter choices;

15       receiving choices of components and their parameters from the system integrator; and

      thereafter, building the integrated program from the completed executable programs in dependence upon the received choices.

2. The method of claim 1, further comprising:

## HAL 177

providing to the system integrator configuration information based upon the choices;

requesting confirmation of the displayed configuration information from the system integrator; and

performing said step of building in response to receiving system integrator confirmation.

3. The method of claim 2, wherein:

each of said steps of providing include displaying the respective choices to the system integrator.

4. The method of claim 3, wherein:

each of said steps of providing, requesting and receiving include interfacing with the system integrator through a web browser with a markup language.

5. The method of claim 3, wherein:

each of said steps of selecting include two way communication via a web browser over a network with storages in a distributed environment.

5

6. The method of claim 5, wherein:

each of said steps of selecting includes generating corresponding ones of the choices in a markup language from configuration files obtained from the storages in the distributed environment.

10

7. The method of claim 1, wherein:

said step of selecting includes two way communication via a web browser over a network with storages in a distributed environment.

15

8. The method of claim 7, wherein:

said step of generating includes generating corresponding ones of the choices in a markup language from configuration files obtained from the storages in the distributed environment.

5 9. The method of claim 7, further including:

selecting plural choices of the types of integration to be performed by the integrated program;

providing to the system integrator the plural choices of types of integration to be performed;

receiving choices from the system integrator from among the choices of types of integration to be performed; and

downloading the complete executable programs in dependence upon received choices of types of integration.

15 10. The method of claim 1, further comprising:

providing to the system integrator an indication of choices made by

## HAL 177

the system integrator and choices not made by the system integrator and requesting confirmation; and

thereafter, in response to receiving system integrator confirmation, performing said step of building the integrated program.

5

11. The method of claim 1, wherein:

each of said steps of selecting include retrieving from storage script that reads configuration files and invoking the script to perform said generating; and

said step of building includes retrieving from storage and invoking script and build tools.

12. The method of claim 1, wherein:

said step of providing to the system integrator plural choices, presents choices of microprocessor cores to which the plurality of completed executable programs are to be mapped, compiler choices,

15

assembly choices , real-time operating system choices, speed choices, and choices of parameters for components of the integrated program including configuration information of performance, power consumption and code size.

5

13. The method of claim 1, wherein:

said step of selecting includes retrieving from storage script that reads configuration files and executing at least some of the script for retrieving from storage markup language code that describes configuration files for use by said step of providing.

10

14. The method of claim 13, wherein:

said step of selecting includes storing the configuration files in a distributed environment.

15

15. The method of claim 1, wherein:

said step of providing to the system integrator plural choices and  
said step of receiving are each conducted for choices of media type,  
processor identification, optimization level, and endianness.

5

16. A configuration tool for use in a computer system and for  
interfacing with a system integrator in integrating programs, said  
configuration tool comprising:

storage media having physical implementation of code for  
performing the method of claim 1.

10

17. A configuration tool for use in a computer system and for  
interfacing with a system integrator in integrating programs, said  
configuration tool comprising:

storage media having physical implementation of code for  
performing the method of claim 3.

15

18. A configuration tool for use in a computer system and for  
interfacing with a system integrator in building an integrated program, said  
configuration tool comprising:

5 storage media having physical implementation of code for  
performing the method of claim 5.

19. A configuration tool for use in a computer system and for  
interfacing with a system integrator in integrating programs, said  
configuration tool comprising:

10 storage media having physical implementation of code for  
performing the method of claim 6.

20. A configuration system comprising the configuration tool of claim  
15 16, for operation in a distributed environment, the system further

comprising:

at least one computer coupled to said configuration tool;

a web browser coupled to said computer and said configuration tool

for interfacing with the system integrator and with said storage media for

the steps of selecting and receiving;

a display coupled to said web browser for interfacing with the

system integrator for the step of providing;

said storage media being in a distributed environment and having

physical implementation of configuration files of component specifications

in machine-readable form, and containing machine-readable component

files for said plurality of completed executable programs;

said storage media further having physical implementation of

machine-readable display page formats for interfacing with the system

integrator during the steps of providing and receiving; and

software build tools coupled to said configuration tool.

21. The configuration system according to claim 20, wherein

said configuration files are of media type, processor cores to which  
executable programs are to be mapped, compiler and assembly options,  
real-time operating systems, speed optimization levels, and parameters of  
the plurality of completed executable programs; and

said storage media stores physical implementations of said page  
formats in a markup language for choices of media type, processor cores,  
speed optimization levels, and parameters of the plurality of completed  
executable programs.

22. A configuration tool for use in a computer system having

configuration files and interfacing with a system integrator in integrating  
programs from a plurality of completed executable programs, said  
configuration tool comprising:

means for reading configuration files in response to input of system  
integrator commands;

means for describing read configuration files as configuration choices to the system integrator;

means for formatting and for presenting to the system integrator configuration data for the integrated program, and for requesting confirmation of the configuration data;

means for controlling downloading of the plurality of completed executable programs from storage and corresponding to system integrator choices; and

means for building the integrated program from the components, in response to receiving system integrator confirmation.

23. A configuration system comprising the configuration tool of claim 22, for operation in a distributed environment, the system further comprising:

at least one computer coupled to said configuration tool;

storage media having physical implementation of display page

formats for interfacing with the system integrator;

software build tools coupled to said configuration tool; and

a web browser coupled to said computer and said configuration tool

for interfacing with the system integrator and with storage media in a

distributed environment.

5

24. The configuration system according to claim 23, further

including:

storage media having physical implementation of at least some of

the configuration files in a markup language.

10

25. The configuration system according to claim 24, further

including:

storage media having physical implementation of script physically

implementing a method of reading configuration files in response to input

15

of choices from the system integrator.

26. The configuration system according to claim 23, further

including:

storage media having physical implementation of script physically  
implementing a method of reading configuration files in response to input  
of choices from the system integrator.

27. The configuration system according to claim 22, wherein

said means for controlling downloading communicates with the  
storage in a distributed environment.
